

“2B has TB...Now What?”

PUBLIC AWARENESS OF DRUG RESISTANT STRAINS OF TUBERCULOSIS IS AT AN ALL TIME HIGH!

The Good News...

There is a Modern Alternative to the 100-year old Tuberculin Skin Test:

QuantiFERON®-TB Gold (QFT-G)

A whole blood test for detection of tuberculosis with a number of benefits over the tuberculin skin test (TST):

- QFT-G requires only one visit
- TST requires 2 visits; one to place, and a second (2-3 days later) to read
- QFT-G is an objective test, with a “yes” or “no” answer
- TST is subjective to reader bias/interpretation, (i.e. 9 mm is negative vs. 10 mm is positive)
- QFT-G is a more specific test than TST; it eliminates false positives due to BCG vaccination
- TST can be positive even when someone does not have a TB infection
- QFT-G is a blood test done in a laboratory; no possibility of side effects
- TST tuberculin is injected into the body to induce a reaction, sometimes causing adverse side effects

Which Test Will You Choose?
